Swift ship tracker

USER STORY:

As a customer, I want to track my shipment using a unique tracking number so that I can easily know where my package is and when it is expected to arrive. The Swift Ship Tracker allows me to enter my tracking number and view the latest shipment information in real time. I can see important details such as the shipment status, current location, estimated delivery date, and complete tracking history. The system shows different stages of delivery, such as order placed, shipment picked up, in transit, arrived at the local hub, out for delivery, and delivered.

I also want to receive notifications whenever there is an important update to my shipment, such as a delay, change in delivery status, or successful delivery. The system should provide clear and accurate information so that I can plan accordingly and avoid uncertainty about my package. If the tracking number is incorrect or the shipment cannot be found, the system should display an appropriate error message. After delivery, the system should show the delivery date and time along with confirmation that the package has been successfully delivered. This tracking feature helps customers monitor their shipments conveniently and provides better visibility throughout the delivery process.

1. INTRODUCTION

1.1 Project Overview :

The **Swift Ship Tracker** is a web-based shipment tracking system developed to help customers easily monitor the status and location of their packages. The system uses a unique tracking number to provide customers with real-time shipment information, including the current location, delivery status, estimated delivery date, and tracking history.

The system can also provide notifications whenever there is a change in the shipment status, such as a package being dispatched, delayed, out for delivery, or delivered. If an invalid tracking number is entered, the system displays an appropriate error message.

The main objective of the Swift Ship Tracker is to make shipment tracking simple, fast, and transparent. It improves customer convenience by providing updated delivery information and helps shipping companies manage and communicate shipment details efficiently. Overall, the project provides a reliable platform for tracking packages and improving the overall delivery experience.

1.2 Purpose:

The purpose of the Swift Ship Tracker (SST) is to provide a simple, fast, and reliable way for customers to track their shipments throughout the delivery process. The system allows users to enter a unique tracking number and view important information such as the current location, shipment status, estimated delivery date, and tracking history.

The system is designed to reduce uncertainty about package deliveries and provide customers with timely updates. It also helps shipping companies manage shipment information efficiently and improve communication with customers. By providing accurate and easily accessible tracking information, SST aims to improve customer satisfaction, reduce the need for manual tracking inquiries, and make the overall shipment management process more convenient and transparent.

2. IDEATION PHASE

2.1 Problem Statement (Customer Problem Template)

S.No	Customer Problem	Problem Description	Impact on Customer
1	Lack of shipment visibility	Customers cannot easily know where their package is during delivery.	Creates uncertainty and confusion.
2	Delayed status updates	Shipment information may not be updated frequently.	Customers cannot accurately estimate delivery time.
3	Unknown delivery time	Customers may not know when the package will arrive.	Makes it difficult to plan their schedule.
4	Difficulty tracking shipments	Customers may need to contact customer support for shipment details.	Wastes time and increases inconvenience.
5	Delivery delays	Customers may not receive timely information about delays.	Causes frustration and inconvenience.

2.2 Empathy Map Canvas

User Persona: Customer / Sender

Empathy Area	Customer Perspective
Says	"Where is my package?" "When will my order arrive?" "I want accurate tracking information." "I need to know if my shipment is delayed."
Thinks	"Is my package safe?" "Will it arrive on time?" "Why hasn't the tracking status changed?" "Can I trust the estimated delivery date?"
Does	Enters the tracking number, checks the shipment status frequently, contacts customer support when information is unavailable, and checks notifications for delivery updates.
Feels	Anxious when the shipment is delayed, frustrated when tracking information is unclear, and satisfied when accurate and timely updates are provided.
Pains	Delayed updates, unclear shipment status, unknown delivery time, lack of notifications, difficulty contacting support, and uncertainty about package location.
Gains	Real-time tracking, accurate delivery estimates, timely notifications, clear shipment history, easy access to information, and confidence that the package is being delivered safely.
Needs	A simple and reliable tracking system that provides accurate shipment status, current location, estimated delivery time, and notifications about important updates.

2.3 Brainstorming & Idea Prioritization

Ideas Considered

S.No	Idea
1	Real-time shipment tracking
2	Tracking number search
3	Delivery status updates
4	Estimated delivery time
5	SMS/Email notifications
6	Tracking history
7	Delivery delay alerts
8	Simple and user-friendly interface

Final Selection

Salesforce CRM selected due to:

S.No	Final Feature	Priority
1	Customer Registration/Login	High
2	Shipment Tracking	High
3	Real-Time Status Updates	High
4	Estimated Delivery Date	High

S.No	Final Feature	Priority
5	Tracking History	High
6	Delivery Notifications	Medium
7	Delay Alerts	Medium
8	Customer Support	Medium

3. REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

Stages:

Customer Journey Map – Stages

1. **Order Placed**
2. **Shipment Created**
3. **Shipment Picked Up**
4. **In Transit**
5. **Arrived at Local Hub**
6. **Out for Delivery**
7. **Delivered**

3.2 Solution Requirements

Functional Requirements

S.No	Functional Requirement
1	The system shall allow customers to register and log in to their accounts.
2	The system shall allow customers to enter a tracking number to find their shipment.
3	The system shall display the current shipment status.
4	The system shall display the current location of the shipment.
5	The system shall show the estimated delivery date and time.
6	The system shall maintain and display the complete tracking history of a shipment.
7	The system shall send notifications when the shipment status changes.
8	The system shall provide delay alerts when a shipment is delayed.
9	The system shall allow customers to view shipment details such as tracking ID, sender, receiver, and delivery information.
10	The system shall allow customers to contact customer support for shipment-related issues.
11	The system shall allow administrators to add, update, and manage shipment information.
12	The system shall display an error message when an invalid or unavailable tracking number is entered.

Non - Functional Requirements

S.No	Requirement	Description
1	Performance	The system should respond quickly to customer requests and tracking searches.
2	Security	Customer and shipment information should be protected from unauthorized access.
3	Reliability	The system should provide accurate tracking information and work consistently.
4	Availability	The system should be available whenever customers need to track their shipments.
5	Usability	The application should have a simple and user-friendly interface.
6	Scalability	The system should support an increasing number of customers and shipments.
7	Maintainability	The system should be easy to maintain, update, and fix.
8	Accuracy	Shipment status and delivery information should be accurate and up to date.
9	Compatibility	The system should work properly on different browsers and devices.
10	Privacy	Customer personal and shipment information should be kept confidential.

3.4 Technology Stack

Layer	Technology
Frontend	HTML, CSS, JavaScript
UI Framework	Bootstrap
Backend	Python / Django
Database	MySQL
AI / ML	Python, Machine Learning
API	REST API
Tracking	GPS / Location API
Notifications	Email / SMS API
Authentication	User Login & Password
Development Tool	Visual Studio Code
Version Control	Git & GitHub
Deployment	Cloud Server

4. PROJECT DESIGN PHASE

4.1 Problem - Solution Fit

Customer Problem	Swift Ship Solution
Customers do not know the location of their package.	Provides real-time shipment tracking.
Customers are unsure about delivery time.	Provides estimated delivery date and time.
Tracking information is not updated regularly.	Provides updated shipment status.
Customers are not informed about delays.	Sends delay alerts and notifications.
Customers cannot easily view shipment history.	Provides complete tracking history.
Customers need to contact support for updates.	Provides shipment information directly through the tracker.
Customers are confused by unclear tracking information.	Provides a simple and user-friendly tracking interface.
Customers worry about whether the package was delivered.	Provides delivery confirmation.

4.2 Proposed Solution

Functional Solution

S.No	Functional Requirement	Proposed Solution
1	User Registration & Login	Allow customers to create an account and securely log in.

S.No	Functional Requirement	Proposed Solution
2	Shipment Tracking	Allow customers to enter a tracking ID and view shipment details.
3	Real-Time Status	Display the latest shipment status and location.
4	Delivery Prediction	Provide the estimated delivery date and time.
5	Tracking History	Show the complete journey of the shipment.
6	Notifications	Send notifications when the shipment status changes.
7	Delay Detection	Identify shipment delays and notify customers.
8	Delivery Confirmation	Display confirmation after the package is delivered.
9	Customer Support	Allow customers to report shipment-related issues.
10	Admin Management	Allow administrators to add, update, and manage shipment information.

5. PROJECT PLANNING & SCHEDULING

5.1 Project planning

Project Planning – Swift Ship Tracker

Project planning is the process of deciding how the Swift Ship Tracker will be developed step by step.

1. Requirement Analysis – Identify customer needs and system requirements.
2. System Design – Design the application structure, database, DFD, and user interface.
3. Development – Develop the frontend, backend, database, and tracking features.
4. AI Integration – Add AI features for delivery prediction and delay detection.
5. Testing – Test the system to find and fix errors.
6. Deployment – Launch the completed application for users.
7. Maintenance – Update the system and fix problems when required.

Phase	Activities	Output
1. Requirement Analysis	Identify customer needs and system requirements.	Requirement Document
2. Planning & Design	Design system architecture, DFD, user flow, and database.	System Design
3. UI Development	Create login, dashboard, and shipment tracking screens.	User Interface
4. Backend Development	Develop APIs, authentication, and shipment management.	Backend System
5. Database Development	Create and manage customer and shipment databases.	Database
6. AI Integration	Implement delivery prediction and delay detection.	AI Tracking Module
7. Testing	Test functionality, performance, security, and usability.	Tested System

Phase	Activities	Output
8. Deployment	Deploy the application and configure the server.	Working Application
9. Maintenance	Fix issues and improve system features.	Updated System

6. PROJECT DEVELOPMENT PHASE:

Phase 1: Requirement Analysis & Planning

Objective:

Requirement Analysis & Planning – Objectives

The main objectives of Requirement Analysis and Planning for the Swift Ship Tracker are:

- To understand customer needs and problems.
- To identify the required features of the system.
- To define functional and non-functional requirements.
- To plan the system development process.
- To identify the required technologies and resources.
- To define the project scope and goals.
- To ensure the system is simple, reliable, and user-friendly.
- To reduce errors and problems during development.

Defining Project Scope & Objectives

Project Scope:

The Swift Ship Tracker focuses on developing a simple system that allows

customers to track their shipments using a tracking ID. The system provides shipment status, current location, estimated delivery time, tracking history, notifications, and delay alerts. It also allows administrators to manage customer and shipment information.

Project Objectives:

- To provide easy and fast shipment tracking.
- To display accurate shipment status and location.
- To provide estimated delivery information.
- To send notifications and delay alerts.
- To maintain shipment tracking history.
- To improve customer communication and satisfaction.
- To provide a simple and user-friendly tracking system.

Gathering & Analysing User Needs

User Involved:

This step focuses on understanding what customers need from the Swift Ship Tracker.

- Identify the main problems customers face while tracking shipments.
- Collect user feedback about shipment tracking.
- Understand what information customers want to see.
- Identify the need for real-time status and location updates.
- Understand the need for estimated delivery time.
- Identify the need for delay alerts and notifications.
- Analyse user needs and convert them into system requirements.
- Prioritize the most important features for development.

Tool Used:

Salesforce Tool	Purpose in SST
Salesforce CRM	Manage customer and shipment information
Salesforce Lightning App Builder	Create the application interface
Objects & Fields	Store customer, shipment, and tracking data
Flow Builder	Automate shipment status updates and notifications
Apex	Implement custom business logic
SOQL	Retrieve customer and shipment records
Reports & Dashboards	Monitor shipments and delivery performance
Salesforce Maps	Display shipment locations
Email Alerts	Notify customers about shipment updates
Data Loader	Import and export shipment/customer data
Salesforce Security	Control user access and protect customer data

Identifying Key Salesforce Features & Tools Required

For the Swift Ship Tracker (SST) project, Salesforce provides several important features and tools to manage customers and shipments efficiently. Salesforce CRM is used to store and manage customer information, while Custom Objects and Fields are used to store shipment and tracking details. Lightning App Builder helps create a simple and user-friendly interface. Flow Builder can automate shipment status updates,

notifications, and other processes. Apex can be used for custom business logic, while SOQL helps retrieve required customer and shipment data. Reports and Dashboards provide a clear view of shipment and delivery information. Email Alerts can notify customers about status changes, and Salesforce Maps can be used to display shipment locations. These features together support the development of an efficient and reliable Swift Ship Tracker system.

Designing Data Model & Security Model – Swift Ship Tracker

Data Model:

- Create a **Customer** object to store customer details.
- Create a **Shipment** object to store tracking and delivery information.
- Create a **Tracking History** object to store each shipment status update.
- Create a **Notification** object to store notification details.
- Establish relationships between **Customer and Shipment**.
- Establish relationships between **Shipment and Tracking History**.
- Store fields such as tracking ID, status, location, delivery date, and shipment date.
- Use Salesforce reports and dashboards to display shipment information.

Security Model:

- Use **Profiles** to define basic user permissions.
- Use **Roles** to control access based on user responsibilities.
- Use **Permission Sets** to provide additional access when required.
- Use **Sharing Rules** to control access to customer and shipment records.
- Use **Field-Level Security** to protect sensitive customer information.

- Use **Organization-Wide Defaults** to define the basic level of record access.
- Allow only authorized users to create, edit, or delete shipment records.
- Protect customer data from unauthorized access.
- Maintain secure and controlled access to the Swift Ship Tracker system.

Security Model Design:

The Security Model of the Swift Ship Tracker in Salesforce is designed to protect customer and shipment information from unauthorized access. Salesforce provides multiple levels of security to control who can view, create, edit, or delete data.

1. Organization-Wide Defaults (OWD) – Defines the basic access level for customer and shipment records.
2. Profiles – Controls the permissions available to different types of users.
3. Roles – Provides record access based on the user's position in the organization.
4. Permission Sets – Gives additional permissions to specific users without changing their profile.
5. Sharing Rules – Allows selected records to be shared with specific users or groups.
6. Field-Level Security – Protects sensitive fields such as customer contact information.
7. Object Permissions – Controls whether users can create, read, edit, or delete records.
8. Record-Level Security – Ensures users can access only the shipment records they are authorized to view.

9. Login Security – Protects the system using secure authentication and user access controls.
10. Audit and Monitoring – Tracks important changes and user activities to improve security.

Simple Security Flow:

User

↓

Login & Authentication

↓

Profile / Permission Set

↓

Role & Sharing Rules

↓

Object & Field Permissions

↓

Customer / Shipment Data

Phase 2: Salesforce Development – Backend & Configurations

For the Swift Ship Tracker, Salesforce backend development and configuration are used to manage customer and shipment data and automate the tracking process.

- Custom Objects – Create objects such as Customer, Shipment, Tracking History, and Notification.
- Custom Fields – Add fields such as Tracking ID, Shipment Status, Current Location, Delivery Date, and Customer Name.
- Relationships – Connect customers with their shipments and tracking history.
- Flow Builder – Automate shipment status updates, notifications, and delivery processes.
- Apex – Develop custom backend logic when standard Salesforce features are not sufficient.
- SOQL – Retrieve customer and shipment records from Salesforce.
- Validation Rules – Ensure correct and complete shipment information is entered.
- Approval Processes – Manage important shipment-related approvals when required.
- Email Alerts – Automatically notify customers about shipment updates.
- Reports and Dashboards – Display shipment status, delivery progress, and tracking information.
- Security Configuration – Configure profiles, roles, permission sets, and sharing rules to protect data.
- Data Management – Import, update, and maintain customer and shipment records efficiently.

Milestone 1- Salesforce Account

Introduction:

A Salesforce Account is a record used to store information about an organization or company that has a relationship with a business. In the Swift Ship Tracker, an Account can represent a shipping company, business customer, or organization using the shipment tracking service.

Account records can contain details such as company name, phone number, email address, billing address, and other business information. Accounts can also be connected with Contacts, Shipments, Cases, and other Salesforce records, making it easier to manage customer relationships and shipment-related activities in one place.

What is Salesforce?

Salesforce is a cloud-based Customer Relationship Management (CRM) platform used by organizations to manage customers, sales, service, and business processes. It allows businesses to store customer information, automate tasks, manage communications, create reports, and analyze data in one centralized system.

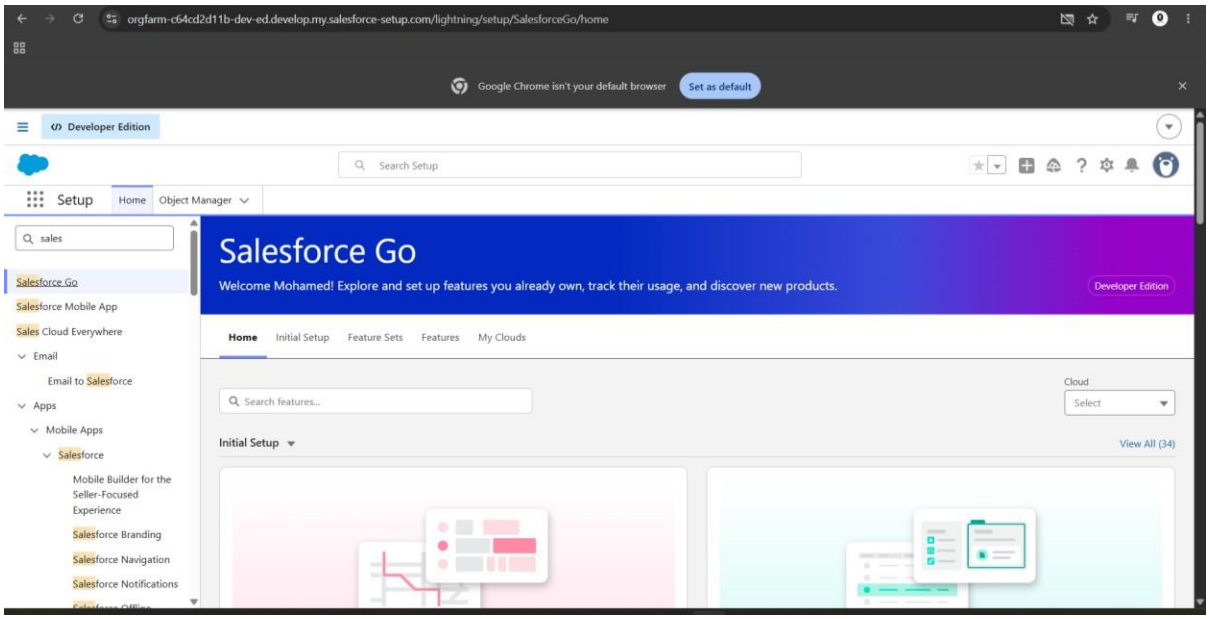

It also provides tools such as Flow Builder, Apex, Reports, Dashboards, and custom objects to build and automate the application.
